

Can PEMF be safely used in conjunction with blood thinning medications such as marcumar or warfarin?

These blood thinning medications intervene directly in the blood clotting system and require periodic measuring against the INR set by your doctor. Because the flow characteristics of the blood stream can be improved by PEMF, we recommend that users who have already used PEMF before receiving blood thinning treatment with the aforementioned medication inform their doctor about the applications and therapy of PEMF.

Should you begin using PEMF whilst being treated with the aforementioned blood thinning medications, we recommend that you inform the doctor, and in the first six weeks of use continuously monitor the INR level that they have prescribed (once per week).
